DynOne bills itself as a "modern Windows emulator". It emulates many different DOS based systems, including Windows 3.0 through 6.3 in 32-bit mode! It is reported that the latest updates to this app includes USB 3.0 support and the option to select particular hardware to emulate with its graphics window that free up valuable real-estate on your PC or laptop's display while gaming!

DynOne's PPC version was released on May 19, 2009, and runs great on modern PPC hardware, up to about 2007. The current release is 2.2.4. Version 2.0 was released on October 24, 2008. Version 1.3 was released on February 24, 2008. An updated version of version 1.2 was released on April 29, 2007 with several bug fixes and improvements to the launcher. Release 1.1 was released March 30, 2007 with updated graphics and drivers for ez-wave controller support, updated AMD64 code base to include drivers for ATI cards (Tahiti) and an updated boot manager to work with XP SP3 bootloader (which may prove useful in the future). Release 1.0 was released February 18, 2007 with several bug fixes to the installer and other minor updates. Version 0.9 was released on February 9, 2007. DynOne was originally designed for Windows 3.1 but is now capable of running many other DOS based systems, including all versions of Windows 3.x through 6.0 in 32 bit mode! It runs fine under XP SP3 with the , but will require an Xbox 360 or Live disc to run Windows 95 or 98 applications that do not support DOS code in the background without side-effects (such as closing down any applications that are being used in the background when one runs a DOS application). DynOne 2. x works fine on modern systems, but takes a few tweaks to get running correctly. However, if running under older systems that support DOS 4.01 or lower, then DynOne does require a little tweaking to get working correctly. It is reported that in some cases it requires an extra 2-3 hours of tweaking with the graphics in the background—for example in order to have the modem in Windows 95 or 98 work properly when using DynOne's modem program. Also note that starting up Windows 3.1 will not automatically clear the DOS box when starting with DynOne loaded since it is not capable of running in foreground mode.
