But as the family traveled through a so-called safe house, where Mexicans who cross are bussed to official shelters, a border patrol agent cornered their caravan. They asked the family to turn back, even though they risked arrest, and escorted them to a different immigration office, where they formally applied for asylum in Mexico. "It was scary," Ms. Campos-Varela, who had not heard of Trump's order, said. "We have no home in Guatemala. We've just been traveling." In South Texas, the makeshift shelter of the family's journey is poised to take on new urgency after the Trump administration's announcement Thursday that it would expand the geographic areas where immigrants would be subject to a new system of mass raids — although asylum-seekers would still generally have to wait in the region in which they seek protection.This invention relates to a flexible container arrangement, and more particularly to a container arrangement for use in a mobile dispensing or distributing system. It is well known that one of the major problems in any liquid dispensing system is ensuring that the liquid is dispensed 1cdb36666d

Field of the Invention The present invention relates to a liquid crystal panel and, more particularly, to a transfective liquid crystal panel. 2. Discussion of the Related Art As information society rapidly develops and computer technologies develop, the requirement of displaying images clearly and efficiently has been gradually increased. In response to the requirement, various flat panel displays such as a liquid crystal display (LCD), a plasma display panel (PDP), a vacuum fluorescent display (VFD), an electro luminescence display (ELD), and a cathode ray tube (CRT) have been recently studied and used, and the LCD, which has the advantages of light weight, thin profile, and low power consumption, is most widely used. In addition, a portable thin flat panel display with a small size is required. Generally, the LCD device controls the light transmissivity of liquid crystal having a dielectric anisotropy by utilizing the optical anisotropy of the liquid crystal in order to display images. In a liquid crystal display, thin film transistors (TFTs) and pixel electrodes connected to the TFTs are arranged in a matrix form to drive a liquid crystal and display images. A transfective LCD, which is operated in both a transmission mode and a reflection mode, is used as a display device as well as a portable display. Particularly, the transfective LCD has high transmittance and low reflectance, and thus can be easily used as a device for displaying an image under any natural or indoor illumination. However, the transfective LCD is problematic in that incident light is reflected on an inner surface thereof, thereby causing deterioration of contrast and deterioration of visibility. Specifically, light incident from a surface of a liquid crystal display panel is reflected on an inner surface
